

Biodiversity Commitment Statement

We are committed to protecting and actively enhancing the biodiversity of our property and surrounding environment. We recognize that our green spaces play an important role in supporting local wildlife, and we will continue to invest in habitat restoration, native planting, and species-friendly infrastructure across our grounds.

In practice, this commitment includes:

- **Annual plantation drives** carried out every rainy season (July–September) to expand and maintain green cover on our property.
- **A dedicated butterfly garden**, developed to support pollinator species through appropriate native and nectar-rich planting.
- **A restored pond habitat**, created to support frogs and fish populations, contributing to a healthier local ecosystem and water-based biodiversity.
- **Owlet conservation**, through the installation of nesting structures that have successfully supported breeding pairs of owlets on-site — a direct measure of habitat quality and species recovery.
- **Responsible chemical use**, with all chemicals on-site being biodegradable and properly stored, and a preference for organic pesticides over chemical alternatives to minimise harm to soil, water, and wildlife.

As a result of these efforts, over 80% of our property is now under green cover, and our on-site naturalist team recorded 80 bird species in a single birding event, reflecting the richness of the habitat we have helped restore.

We will continue to build on these initiatives, monitor their outcomes, and identify further opportunities to reduce our environmental impact and support the wildlife that shares our site.
